A TRULY SUSTAINABLE RADIANT FLOOR SUBSTRATE

ThermalBoard is constructed with a dense fiberboard made from the agricultural post-harvest waste of rice straw rather than felled trees. The rice straw fibers are processed and manufactured to provide excellent dimensional stability and strength. Rather than burning the straw or leaving it to generate methane in the fields, it is transformed into an environmentally conscious MDF product allowing us to create a truly sustainable radiant floor heating product that meets our high standard of excellence.

RESPONDING

RADIANT FLOOR PANEL SYSTEM

Thermalboard is a highly efficient, fast responding radiant heat panel system. Our system was designed to supply lower water temperatures resulting in lower operating costs to the owner. Our fast response system allows for rapid heating up and cooling down for easy control and comfort.

ENERGY EFFICIENCY

While energy efficiency may not be a feature of sustainability, it is a desirable feature for green homes. Thermalboard aluminum laminated low mass system is a highly efficient method for delivering hydronic heat, making our product part of broad-based carbon reduction strategies and an excellent technical partner with geothermal and air to water heat pumps in achieving Net Zero Energy building solutions.
